

CORONAVIRUS CONTROL MOBILITY

We inform you of the **automated coronavirus control system and the mobility restrictions.**

The system allows knowing if a proper control of the general population's mobility and of the sick population is being carried out. In this way, civil protection resources can be managed to avoid, in real time, inadequate inflows in restricted areas and to validate restrictions.

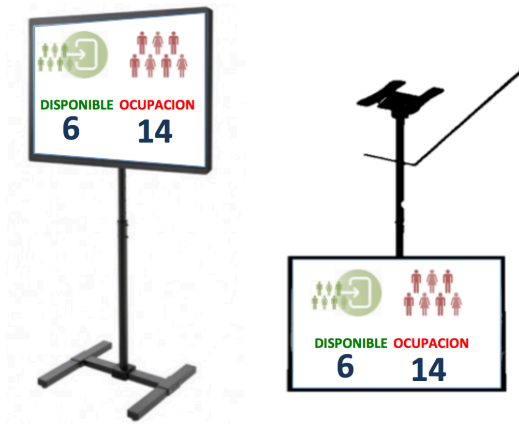

This system is in accordance with the GDPR and can be integrated with systems of medical recommendations (App), surveys or semi-automated medical monitoring, helping to self-detect the disease

The basic operation is described below:

Seeketing equipment (plug & play) is placed in public places with a large influx of people (, transportation hubs, public buildings, kid parks hospitals, in front of supermarkets, pharmacies...)

The Seeketing nodes can analyze the behavior of 80% people's phones in an anonymous and legal way (GDPR compliant) in 15,000 square meters around them, collecting data on flows between areas (origin and destination), concentrations of people, type of behavior (employees , tourists, patients, etc ...) in the areas where they are placed. **Seeketing nodes send alerts to managers / managers /public in real time when a threshold or capacity is exceeded.** Alternative you can use public screens to show the real time occupancy data.

In the health centers and hospitals those affected by coronavirus can be anonymously clasified because they are at specific rooms or, they are committed to register with their mobile phone in said equipment, in order to receive health alerts, recommendations and participate in the control of the pandemic. For the same purpose, it can also integrated with an APP/WEB (to make a self-diagnosis of Coronavirus, avoiding trips to medical services).

In addition to having aggregated data zone by zone in the municipality, the managers receive a message in real time each time a person affected by or quarantined by the coronavirus, visits any of these analyzed and / or restricted areas. Also the patients themselves or people in quarantine receive a whatsapp / sms warning when entering these analyzed areas (programmable according to profile, area, time, maximum recommended capacity).

Once the system is installed, it is also used to analyze flows in events in public and private spaces, mobility (origin and destination of travellers / citizens / tourists), security (control of demonstrations, capacity), and **boost local tourism and commerce (sending messages to tourists and locals), which will be necessary after this crisis has passed.**

The Seeketing system is currently installed in 12 municipalities in the Basque Country, allowing the analysis of flows in its main commercial areas.

The equipment is plug&play installed send it via courier, and quickly we will help control the pandemic at any the municipality / region.
